

CASE FILE: OMNI-2026-ECHO // WAREHOUSE HOMICIDE & DIGITAL TRIAGE

At 1600 hours, responding units arrived at the rear loading dock of the Nexis Tech logistics warehouse. The victim, identified as 28-year-old software engineer David Chen, was found deceased behind a cluster of shipping pallets. The primary witness is the warehouse floor manager, Julian Vance, who reported finding the body. In his official statement, Vance claims that Chen was alive and working at his terminal this morning, stating he last saw the victim well at exactly 2026-05-09T09:30:00.

The on-site medical examiner recorded the ambient loading dock temperature at a stable 72.0°F. The core hepatic temperature of the victim was recorded at 83.4°F. Physical examination revealed full rigor mortis across all major muscle groups. Notably, livor mortis was fully fixed on the anterior (front) torso, despite the body being discovered supine (on its back), indicating post-mortem manipulation and staging. Primary injuries include severe blunt force trauma to the occipital lobe and deep defensive lacerations on the right forearm.

Cyber forensics immediately pulled the victim's digital footprint. The victim's mobile device (C_PHONE) registered a final network handshake with the local cell tower (TOWER_WEST) at 06:02 AM before going completely dark. Investigators secured the raw video feed from the exterior security camera (CAM_DOCK_OUTER) facing the rear exit, which oversees the area where the body was dumped.
